<sup>4</sup> The exemption limits in Table 1 are based on measurements and simulations of half-wave dipole antennas at separation distances of 5 mm to 25 mm from a flat phantom, providing a SAR value of approximately 0.4 W/kg for 1 g of tissue. For low frequencies (300 MHz to 835 MHz), the exemption limits are derived from a linear fit. For high frequencies (1900 MHz and above), the exemption limits are derived from a third order polynomial fit.

<sup>5</sup> Transmitters operating between 0.003-10 MHz, meeting the exemption from routine SAR evaluation, shall

Page 8 of 10 Report No.: 190726004RFC-2

demonstrate compliance to the instantaneous limits in Section 4.

#### 3.2.2 Test Procedure

Software provided by client enabled the EUT to transmit and receive data at lowest, middle and highest channel individually.

## 3.3 MPE CALCULATION RESULTS

**Note:** For the test results, the EUT had been tested with all conditions. But only the worst case was shown in test report.

#### 3.3.1 For BT

For BT\_BR & EDR function, operating at 2402MHz to 2480 MHz for GFSK,  $\pi/4$  DQPSK, 8DPSK

#### 3.3.1.1 Antenna Type:

Chain 0: Monopole Antenna

#### 3.3.1.2 Antenna Gain:

Chain 0: 2402MHz to 2480 MHz: 1.1 dBi

#### 3.3.1.3 Minimum contact distance:

The following is the product antenna location.

The minimum contact distance is more than 15 mm. So, the 15 mm separation distance applies.
