## 2.3 Traceability

All measurement equipment calibrations are traceable to NIM (National Institute of Metrology) or where calibration is performed in other countries, to equivalent nationally recognized standards organizations.

### 2.4 Calibration

Equipment requiring calibration is calibrated periodically by the manufacturer or according to manufacturer's specifications. Additionally all equipment is verified for proper performance on a regular basics using in house standards or comparisons.

### 2.5 Measurement Uncertainty

The estimated combined standard uncertainty for radiated emissions and conducted emissions measurements as below table

| Item                              |                         | Extended Uncertainty |
|-----------------------------------|-------------------------|----------------------|
| Conducted Emission                |                         | ± 2.74 dB            |
| Radiated Emission (30-1000MHz)    | Field strength (dBµV/m) | 4.27dB               |
| Radiated Emission (above 1000MHz) | Field strength (dBµV/m) | 4.46dB               |
| Radio Spectrum                    |                         | ± 1.5 dB             |

# 2.6 Location of Original Data

The original copies of all test data taken during actual testing were attached at Appendix A & B & C of this report and delivered to the applicant. A copy has been retained in the TÜV Rheinland (Shenzhen) file for certification follow-up purposes.

## 2.7 Status of Facility Used for Testing

### **Table 4: Frequency Hopping Information**

| Technical Specification  | Description   |
|--------------------------|---|
| Hopping Range            | Hereby we declare that the frequency range of this device is 2402-2480MHz. This is according the Bluetooth Core Specification V2.1 + EDR for devices which will be operated in the USA. This was checked during the Bluetooth Qualification tests.  |
| Hopping Sequence         | Example of a 79 hopping sequence in data mode:  33,04,21,44,23,42,53,46,55,48,40,59,72,29,76,31,08,73, 07,75,09,45,60,39,58,13,47,11,77,52,35,50,65,54,67,56, 69,62,71,64, 7,25,27,66,57,70,74,61,78,63,10,41,05,43, 15,44,64,68,02,70,06,01,51,03,55,05,03,66,53,49,36,47  |
| Receiver input bandwidth | The input bandwidth of the receiver is 1MHz. In every connection one Bluetooth device is the master and the other one is the slave. The master determines the hopping sequence. The slave follows this sequence. Both devices shift between RX and TX time slot according to the clock of the master.  Additionally the type of connection is set up at the beginning of the connection. The master adapts its hopping frequency and its TX/RX timing according to the packet type of the connection. Also the slave of the connection will use these settings.  Repeating of a packer has no influence on the hopping sequence. The hopping sequence generated by the master of the connection will be followed in any case.  That means a repeated packet will not be send on the same frequency, it is send on the next frequency of the hopping sequence. |

#### Remark:

During the pretest the EUT was rotated through three orthogonal axes to determine the attitude that maximizes the emissions. After that the EUT was manually handled to find the orientation that has the maximum emission, which is the orientation shown in the test set-up photos.

Testing was carried out within frequency range 9kHz to the tenth harmonics.

## 6 Safety Human Exposure

## 6.1 Radio Frequency Exposure Compliance

### **6.1.1 Electromagnetic Fields**

RESULT: Pass

**Test Specification** 

Test standard : CFR47 FCC Part 2.1091

RSS-102 Issue 5 March 2015 FCC KDB Publication 447498 v06

Limit : CFR47 FCC Part 1.1310

The separation distance of the EUT should be 50mm. The measured maximum conducted power of the EUT is 2.53dBm  $\approx$  2.36 mW , which is far below the SAR exclusion threshold level 96mW (Appendix A, SAR Test Exclusion Thresholds for 100 MHz – 6 GHz and  $\leq$ 50 mm), hence the EUT is excluded from SAR evaluation according to FCC KDB publication 447498 D01: Mobile and Portable RF Exposure. Guidance v06.

The separation distance of the EUT should be 50mm. The measured maximum specified e.i.r.p of the EUT is  $5.12dBm \approx 4.20mW$ , which is far below the SAR exclusion threshold level 309mW, hence the EUT is excluded from SAR evaluation according to RSS-102 Issue 5 section 2.5.1.
